

Compliance Reporting Module (CRM)

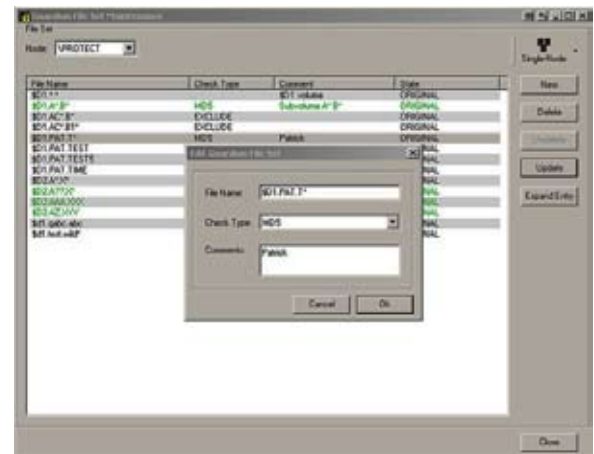

The Compliance Reporting Module is a new compliance tool that will serve as a replacement of CSP's Tandem Security Analyzer (TSA). CRM can be run as a stand alone product or integrated in the Protect XP suite. CRM is an audit compliance tool to assist with current data security regulations such as PCI DSS, SOX, and HIPAA. Templates for different regulations are provided to compare current system security settings against the required legislation. Pre-defined reports are included to report on the level of compliance plus any recommended changes needed to meet the regulations.

CRM key features:

- Pre-built compliance rules
- Detailed reporting on regulatory compliance
- Supports: PCI DSS, SOX, HIPAA, and allows for custom modifications
- File Integrity Checking (FIC) to verify any changes of critical files
- Baseline file fingerprint generated for each protected file
- Meets PCI DSS regulation 11.5
- Intuitive GUI makes compliance checking and audit reporting easy

The Benefits of CRM

CRM is a comprehensive audit reporting tool with built in compliance regulations. This makes it easy to determine if your NonStop platform is compliant with the regulations that apply to you. It also provides a powerful file integrity checker to comply with the PCI DSS regulation 11.5. CRM keeps a complete history of compliance rules and the report results. This will save you time and make regulatory compliance a much simpler task.

CRM Compliance Management

CRM is preconfigured with a base set of rules such as those defined for PCI DSS, SOX, NSK best practices and HIPAA. The rules will be categorized into subsets according to the type of check being done and the regulatory body to which the rule applies.

CRM

Compliance Reporting Module

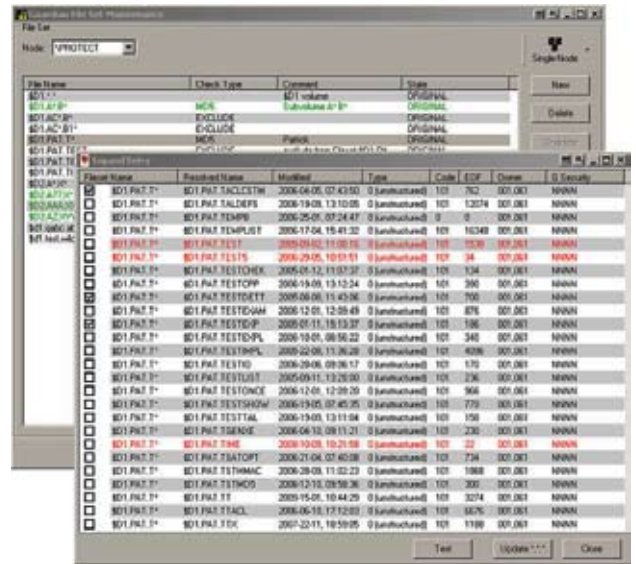

File Integrity Checker (FIC)

FIC is a comprehensive file integrity monitor which will verify any changes to critical files. It provides alerts for any unauthorized modification to critical files. A list of critical files is built based on system and application files that need to be monitored to prevent unauthorized change. The files are selected and placed in a database, each file is given a unique fingerprint. Alerts and reports can be generated to verify that there have been no unauthorized changes to critical files.

Client Interface

Easy file browsing and management with the comprehensive GUI. The compliance rules can be filtered or sorted to enable custom reporting for the various regulations. Rule sets are preconfigured for the latest regulations but can be updated or new ones created as regulations are adjusted.

Integrated Enterprise Security

CRM is designed to work with our suite of security tools to provide a complete security solution for your HP NonStop servers. CSP can help you meet today's demanding security regulations and provide detailed audit reporting.

Let us show you how CSP can secure your data and provide compliance to your NonStop security policy.
