

File Integrity Checker

File Integrity Checker (FIC)

FIC is a comprehensive file integrity monitor which verifies any changes to a selected group of files. Files that are critical to system operation and data security are copied to the FIC database and given a unique fingerprint which can be compared against the original to determine if any changes have been made. Alerts can be generated to prevent unauthorized modification to critical files. Reports can be created to verify that there have been no unauthorized changes.

File Integrity Checker key features:

- Monitors a list of critical files
- User selected Guardian or OSS files
- Meets PCI DSS regulation 11.5
- Unique file fingerprint
- GUI display for file management
- Audit compliance information can be automatically processed by Alert-Plus and sent to the compliance warehouse of your choice
- Full audit reporting capability
- Audit database of change history
- Alerts for unauthorized change
- Critical system files are built in

File Check Run shows failed files

The Benefits of File Integrity Checker

Preventing unauthorized changes to critical files is required to maintain data security. File Integrity Checker is designed to work with the Compliance Reporting Module to provide full audit and monitoring capability for OSS and Guardian environments. Its intuitive graphic interface makes it easy to set-up and manage a group of critical files that will be monitored for change. File Integrity monitoring is a critical part of PCI data security standard to protect cardholder information.

File Integrity Checker

File Integrity Reports

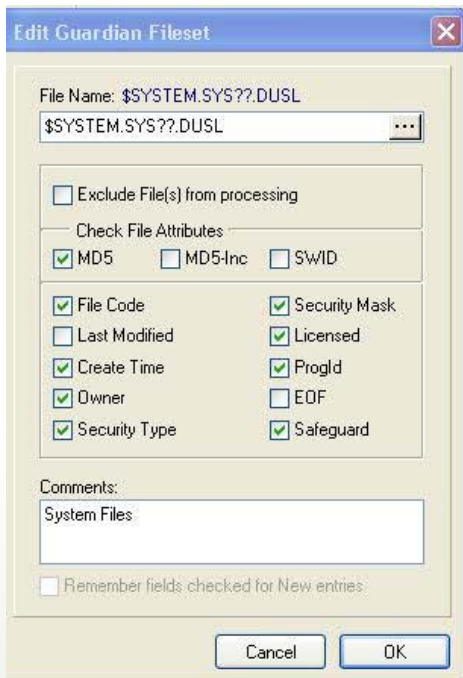

File Integrity Checker runs a wide range of reports of any changes made to critical files. Reports are run based on file sets that have been predetermined by the administrator. The user can schedule automated reports or run checks manually when required. The administrator can run detailed analysis of all protected files or choose a specific file to be checked for various activities. File Integrity Checker will report any and all modifications and the users associated with those modifications. The results can be displayed in FIC's graphic interface or sent to the print spooler. Comparisons can be run against previous reports to determine the changes between reports. The administrator has an option to check files by selecting one or many criteria at the same time.
